Fourier Analysis and Approximation Theory

Contents

1. IVP for a linear dispersive system
2. Dispersive flows into Riemann surfaces
3. Well-posedness of the IVP
4. Direct proof of the sufficiency
5. Moving frames along closed curves.
6. Geometric reduction of the dispersive flows

1. IVP for a linear dispersive system

$$L\vec{u} \equiv \left\{ I \frac{\partial}{\partial t} + J \frac{\partial^4}{\partial \mathbf{x}^4} + \mathbf{B}(\mathbf{x}) \frac{\partial^2}{\partial \mathbf{x}^2} + \mathbf{C}(\mathbf{x}) \frac{\partial}{\partial \mathbf{x}} \right\} \vec{u} = \vec{f}(t, \mathbf{x}), \quad (1)$$

$$\vec{u}(\mathbf{0}, \mathbf{x}) = \vec{u}_0(\mathbf{x}), \quad (2)$$

- where

- ▶ $\mathbb{R} \times \mathbb{T} \ni (t, \mathbf{x}) \mapsto \vec{u}(t, \mathbf{x}) \in \mathbb{R}^2$ unknown,
- ▶ $\vec{f}(t, \mathbf{x}), \vec{u}_0(\mathbf{x})$ given, $\mathbb{T} = \mathbb{R}/2\pi\mathbb{Z}$,
- ▶ $I, J, \mathbf{B}(\mathbf{x})$ and $\mathbf{C}(\mathbf{x})$ are 2×2 real matrices

$$I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, \quad J = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}, \quad \mathbf{B}(\mathbf{x}), \mathbf{C}(\mathbf{x}) \in C^\infty(\mathbb{T}; M_2(\mathbb{R})).$$

- $\mathbf{B}(\mathbf{x}) + {}^t\mathbf{B}(\mathbf{x}) = \mathbf{0}, \quad \mathbf{C}(\mathbf{x}) - {}^t\mathbf{C}(\mathbf{x}) = \mathbf{0}$

⇒ Energy estimates work for (1).

2. Dispersive flows into Riemann surfaces

$$\begin{aligned} \mathbf{u}_t = & \mathbf{a} \tilde{\mathbf{J}}_u \nabla_x^3 \mathbf{u}_x + \{1 + \mathbf{b} \mathbf{g}_u(\mathbf{u}_x, \mathbf{u}_x)\} \tilde{\mathbf{J}}_u \nabla_x \mathbf{u}_x \\ & + \mathbf{c} \mathbf{g}_u(\nabla_x \mathbf{u}_x, \mathbf{u}_x) \tilde{\mathbf{J}} \mathbf{u}_x, \end{aligned} \quad (3)$$

- where

- ▶ $\mathbb{R} \times \mathbb{T} \ni (\mathbf{t}, \mathbf{x}) \mapsto \mathbf{u}(\mathbf{t}, \mathbf{x}) \in \mathbf{N}$ unknown,
- ▶ $(\mathbf{N}, \tilde{\mathbf{J}}, \mathbf{g})$ a compact Riemann surfaces,
- ▶ $\mathbf{a}, \mathbf{b}, \mathbf{c} \in \mathbb{R}$, $\mathbf{a} \neq \mathbf{0}$ constants,
- ▶ ∇_t, ∇_x covariant derivatives along \mathbf{u} .

- (3) models the motion of vortex filaments and spin-chain systems.
- Onodera: The sectional curvature is constant.
 \Rightarrow short-time existence (**uniqueness ?**).
- $\mathbf{a} = \mathbf{b} = \mathbf{c} = \mathbf{0} \Rightarrow$ (3) becomes $\mathbf{u}_t = \tilde{\mathbf{J}} \nabla_x \mathbf{u}_x$.
- C (2013): short-time existence of the Schrödinger flow from closed Riemannian manifolds into compact almost Hermitian manifolds.

3. Well-posedness of the IVP

Theorem

The following conditions are mutually equivalent.

- (I) For any $\vec{u}_0 \in L^2(\mathbb{T}; \mathbb{R}^2)$ and for any $\vec{f} \in L^1_{loc}(\mathbb{R}; L^2(\mathbb{T}; \mathbb{R}^2))$, the IVP (1)-(2) has a unique solution $\vec{u} \in \mathbf{C}(\mathbb{R}; L^2(\mathbb{T}; \mathbb{R}^2))$.
- (II)
$$\int_0^{2\pi} \text{tr}(\mathbf{B}(\mathbf{x})) \, d\mathbf{x} = \int_0^{2\pi} \text{tr}(\mathbf{JC}(\mathbf{x})) \, d\mathbf{x} = \mathbf{0}.$$

- $\text{tr}(\mathbf{B}(\mathbf{x})) = \mathbf{b}_{11}(\mathbf{x}) + \mathbf{b}_{22}(\mathbf{x})$, $\text{tr}(\mathbf{JC}(\mathbf{x})) = \mathbf{c}_{12}(\mathbf{x}) - \mathbf{c}_{21}(\mathbf{x})$.
- (I) implies the continuity of $(\vec{u}_0, \vec{f}) \mapsto \vec{u}$.
- **Proof**

Consider more general systems. By using PsDOs, we can diagonalize (1) essentially. The proof is reduced to Mizuhara's results on single equations (2006).

4. Direct proof of the sufficiency 1/2

- Split a 2×2 matrix \mathbf{A} into three parts:

$$\mathbf{A} = \underbrace{\frac{\operatorname{tr}(\mathbf{A})}{2} \mathbf{I} + \frac{1}{2} \{\mathbf{J}\mathbf{A} - \mathbf{A}\mathbf{J}\}}_{(\mathbf{A} + {}^t\mathbf{A})/2} \mathbf{J} - \underbrace{\frac{\operatorname{tr}(\mathbf{J}\mathbf{A})}{2}}_{(\mathbf{A} - {}^t\mathbf{A})/2} \mathbf{J}.$$

- Eliminate $\frac{\operatorname{tr}(\mathbf{B}(\mathbf{x}))}{2} \mathbf{I}, \frac{1}{2} \{\mathbf{J}\mathbf{B}(\mathbf{x}) - \mathbf{B}(\mathbf{x})\mathbf{J}\} \mathbf{J}, -\frac{\operatorname{tr}(\mathbf{J}\mathbf{C}(\mathbf{x}))}{2} \mathbf{J}.$
- Let $r \gg 1$. Pick up $\varphi_r(\xi) \in \mathbf{C}^\infty(\mathbb{R}; \mathbb{R})$ so that $\varphi_r(-\xi) = \varphi_r(\xi),$

$$\varphi_r(\xi) = 1 \quad (|\xi| \geq r + 1), \quad \varphi_r(\xi) = 0 \quad (|\xi| \leq r).$$

- Set $\mathbf{p}_\ell(\xi) = \varphi_r(\xi) / (\sqrt{-1}\xi)^\ell, \ell = 1, 2, 3, \dots$
- $\operatorname{Im} \mathbf{v} = \mathbf{0} \Rightarrow \operatorname{Im} \mathbf{p}_\ell(\mathbf{D}_x) \mathbf{v} = \mathbf{0},$ where $\mathbf{D}_x = -\sqrt{-1} \partial / \partial \mathbf{x}.$
- Suppose (II). Define smooth 2π -periodic functions by

$$\Psi_1(\mathbf{x}) = \int_0^{\mathbf{x}} \operatorname{tr}(\mathbf{B}(\mathbf{y})) \, d\mathbf{y}, \quad \Psi_3(\mathbf{x}) = \int_0^{\mathbf{x}} \operatorname{tr}(\mathbf{J}\mathbf{C}(\mathbf{y})) \, d\mathbf{y} + \dots.$$

4. Direct proof of the sufficiency 2/2

- Define a PsDO Λ by

$$\begin{aligned}\Lambda &= (I - \tilde{\Lambda}_3)(I - \tilde{\Lambda}_2)(I - \tilde{\Lambda}_1), \\ \tilde{\Lambda}_1 &= \frac{1}{8}\Psi_1(\mathbf{x})J\rho_1(D_x), \\ \tilde{\Lambda}_2 &= -\frac{1}{2}\left\{B(\mathbf{x}) - \frac{\text{tr}(B(\mathbf{x}))}{2}I\right\}J\rho_2(D_x), \\ \tilde{\Lambda}_3 &= -\frac{1}{4}\Psi_3(\mathbf{x})I\rho_2(D_x).\end{aligned}$$

- Λ is invertible on $L^2(\mathbb{T}; \mathbb{R}^2)$ for $r \gg 1$, and

$$\Lambda L \Lambda^{-1} = I \frac{\partial}{\partial t} + J \frac{\partial^4}{\partial x^4} - \frac{\partial}{\partial x} \frac{\text{tr}(JB(\mathbf{x}))}{2} J \frac{\partial}{\partial x} + \mathbf{C}_1(\mathbf{x}) \frac{\partial}{\partial x} + \dots,$$

where $\mathbf{C}_1(\mathbf{x})$ is a symmetric matrix.

5. Moving frames along closed curves

- Let $\mathbf{u} \in \mathbf{C}^\infty(\mathbb{R} \times \mathbb{T}; \mathbf{N})$ be a solution to (3).
Suppose that $\mathbf{u}_x(\mathbf{t}, \mathbf{0}) \neq \mathbf{0}$ for all $\mathbf{t} \in \mathbb{R}$. Set

$$\mathbf{e}_0(\mathbf{t}) = \frac{\mathbf{u}_x(\mathbf{t}, \mathbf{0})}{\sqrt{\mathbf{g}_{\mathbf{u}(\mathbf{t}, \mathbf{0})}(\mathbf{u}_x, \mathbf{u}_x)}}, \quad \gamma(\mathbf{t}) = \{\mathbf{u}(\mathbf{t}, \mathbf{x}) \mid \mathbf{x} \in \mathbb{T}\}.$$

- Let $\mathbf{e}(\mathbf{t}, \mathbf{x})$ be a solution to $\nabla_x \mathbf{e} = \mathbf{0}$, $\mathbf{e}(\mathbf{t}, \mathbf{0}) = \mathbf{e}_0(\mathbf{t})$.
- $\{\mathbf{e}, \tilde{\mathbf{J}}\mathbf{e}\}$ is a moving frame along $\gamma(\mathbf{t})$.
- $\nabla_x \tilde{\mathbf{J}}\mathbf{e} = \mathbf{0}$, $\tilde{\mathbf{J}}\mathbf{e}(\mathbf{t}, \mathbf{0}) = \tilde{\mathbf{J}}\mathbf{e}_0(\mathbf{t})$ since $\nabla^N \tilde{\mathbf{J}} = \mathbf{0}$.
- Note that $\mathbf{e}(\mathbf{t}, \mathbf{0}) \neq \mathbf{e}(\mathbf{t}, \mathbf{2}\pi)$ in general.
- Let $2\pi\theta(\mathbf{t})$ be the holonomy angle of $\gamma(\mathbf{t})$.

If $\gamma(\mathbf{t})$ is a boundary of contractive domain $\Omega(\mathbf{t})$, then

$$\theta(\mathbf{t}) = \frac{1}{2\pi} \int_{\Omega(\mathbf{t})} \mathbf{K}(\mathbf{u}) d\mathbf{u}^1 \wedge d\mathbf{u}^2,$$

where $\mathbf{K}(\mathbf{u})$ is the sectional curvature at $\mathbf{u} \in \mathbf{N}$.

6. Geometric reduction of dispersive flows 1/3

Theorem

If $\mathbf{K}(\mathbf{u})$ is constant, then (3) has nice structure so that the IVP is solvable.

- History of geometric reduction

- ▶ Chang-Shatah-Uhlenbeck (2000): the Schrödinger map equation.
- ▶ Onodera (2008): third and fourth-order equations.
- ▶ The case of $\mathbf{x} \in \mathbb{R}$ with a base point $\mathbf{u}_\star = \lim_{\mathbf{x} \rightarrow \infty} \mathbf{u}(\mathbf{t}, \mathbf{x})$.
- ▶ A \mathbb{C} -valued equation is obtained from that for $\mathbf{u}_\mathbf{x}$.

It is hard to distinguish the unknown and the coefficients.

It is hard to know that $\sqrt{-1}$ corresponds to $\tilde{\mathbf{J}}$ or not.

- We shall obtain a 2×2 system from the equation for a higher order derivative $\nabla_{\mathbf{x}}^\ell \mathbf{u}_\mathbf{x}$, $\ell = 4, 5, 6, \dots$

6. Geometric reduction of dispersive flows 2/3

- Set $\nabla_x^\ell \mathbf{u}_x = \mathbf{V}\mathbf{e} + \mathbf{W}\tilde{\mathbf{J}}\mathbf{e}$ for $\ell = 4, 5, 6, \dots$
- Let \mathbf{R} be the Riemann curvature tensor of $(\mathbf{N}, \tilde{\mathbf{J}}, \mathbf{g})$.
- Using the following properties

$$\mathbf{R}(\tilde{\mathbf{J}}\mathbf{e}, \mathbf{e})\mathbf{e} = \mathbf{K}(\mathbf{u})\tilde{\mathbf{J}}\mathbf{e}, \quad \tilde{\mathbf{J}}\mathbf{R}(\tilde{\mathbf{J}}\mathbf{e}, \mathbf{e})\mathbf{e} = \mathbf{R}(\tilde{\mathbf{J}}\mathbf{e}, \mathbf{e})\tilde{\mathbf{J}}\mathbf{e}, \dots$$

we obtain

$$\left\{ I \frac{\partial}{\partial t} - \mathbf{a}\mathbf{J} \frac{\partial^4}{\partial \mathbf{x}^4} + \hat{\mathbf{B}}(\mathbf{t}, \mathbf{x}) \frac{\partial^2}{\partial \mathbf{x}^2} + \hat{\mathbf{C}}(\mathbf{t}, \mathbf{x}) \frac{\partial}{\partial \mathbf{x}} \right\} \begin{bmatrix} \mathbf{V} \\ \mathbf{W} \end{bmatrix} = \dots,$$

- $\text{tr}(\hat{\mathbf{B}}(\mathbf{t}, \mathbf{x})) \equiv 0,$

$$\int_0^{2\pi} \text{tr}(\mathbf{J}\hat{\mathbf{C}}(\mathbf{t}, \mathbf{x})) \, d\mathbf{x} = -\frac{\mathbf{a}}{2} \int_0^{2\pi} \mathbf{g}_u(\mathbf{u}_x, \mathbf{u}_x) \frac{\partial}{\partial \mathbf{x}} \mathbf{K}(\mathbf{u}) \, d\mathbf{x}.$$

6. Geometric reduction of dispersive flows 3/3

- Correction

$$\vec{z} = \begin{bmatrix} \cos(\theta(t)\mathbf{x}) & -\sin(\theta(t)\mathbf{x}) \\ \sin(\theta(t)\mathbf{x}) & \cos(\theta(t)\mathbf{x}) \end{bmatrix} \begin{bmatrix} \mathbf{V} \\ \mathbf{W} \end{bmatrix}.$$

- $\vec{z} \in \mathbf{C}^\infty(\mathbb{R} \times \mathbb{T}; \mathbb{R}^2)$ and \vec{z} solves

$$\left\{ I \frac{\partial}{\partial t} - \mathbf{aJ} \frac{\partial^4}{\partial \mathbf{x}^4} - \mathbf{a}\theta(t)I \frac{\partial^3}{\partial \mathbf{x}^3} + \hat{\mathbf{B}}_1(t, \mathbf{x}) \frac{\partial^2}{\partial \mathbf{x}^2} + \hat{\mathbf{C}}_1(t, \mathbf{x}) \frac{\partial}{\partial \mathbf{x}} \right\} \vec{z} = \dots,$$

- $\text{tr}(\hat{\mathbf{B}}(t, \mathbf{x})) = \text{tr}(\hat{\mathbf{B}}_1(t, \mathbf{x})), \quad \text{tr}(\mathbf{J}\hat{\mathbf{C}}(t, \mathbf{x})) = \text{tr}(\mathbf{J}\hat{\mathbf{C}}_1(t, \mathbf{x})).$
